

Event & Vendor Marketplace

A unified platform for discovering events, managing vendors, purchasing tickets, and planning the complete event experience.

Client: Confidential (NDA)
Type: Multi-Sided Marketplace
Role: Solo Full-Stack Developer

Industry: Events & Hospitality
Timeline: 3 months
Delivery: End-to-End Web Platform

01 — Executive Summary & Challenge

Event planning is typically fragmented across multiple platforms for ticketing, vendor sourcing, and travel. This platform consolidates the entire journey into a single ecosystem. It connects **Attendees** (discovery & ticketing), **Organizers** (event creation, vendor sourcing, ticketing), **Vendors** (profiles, bidding, service management), and **Administrators** (platform moderation) into one seamless marketplace.

02 — Platform Ecosystem & Roles

Attendee Experience

Discover → Explore → Purchase → Attend

Users browse events, view details, and securely purchase tickets via Stripe without leaving the ecosystem. OAuth streamlines login.

Organizer Experience

Create → Plan → Source → Negotiate → Manage

Organizers create events (manually or AI-assisted), sell tickets, request quotes, compare bids, negotiate, and manage accepted services.

Vendor Experience

Onboard → Publish → Discover → Bid → Negotiate

Vendors use an AI-powered onboarding flow to generate a professional profile, receive quote requests by postal code, and manage bids from a dedicated dashboard.

Administration Platform

Monitor → Moderate → Resolve → Manage

Admins monitor activity, flag events, manage users (including ban/unban), handle disputes, and process refunds from one dashboard.

03 — Technical Architecture & Integrations

The platform was built as a modern, serverless ecosystem on AWS.

Frontend: Next.js, Tailwind CSS, AWS Amplify

Backend: NestJS, AWS Lambda (Serverless)

Database: PostgreSQL on AWS RDS

Payments: Stripe

Events: Ticketmaster, Eventbrite APIs

Travel: Flight & Hotel APIs

AI: Hugging Face / AI services

Comms: Resend, Brevo SMTP, Mailchimp

Engineering Challenges Solved

- Multi-Sided Marketplace:** Unified infrastructure supporting three distinct role-based experiences.
- Complex Bidding Workflows:** Explicit state machines for vendor discovery, requests, bids, and negotiations.
- AI inside Workflows:** AI practically integrated into event creation and vendor profiling, not just as a chatbot.
- Disputes & Payments:** Structured work-order logic, payment windows, and refund management.

04 — End-to-End Delivery & Results

Timeline: 3 months (solo developer). From initial architecture to full AWS deployment, this project replaced fragmented tools with one cohesive product.

The result is a fully functional multi-sided marketplace featuring AI workflows, integrated payments, and centralized moderation.

05 — Visual Product Showcase

Event discovery with filters for location, date, and price.

Event details leading directly into ticket purchasing.

Vendor workspace for packages, requests, bids, and payouts.

AI-powered onboarding that turns vendor information into a structured marketplace profile.

Confidentiality note

Client identity and confidential business information have been omitted in accordance with the applicable NDA. Technical capabilities are presented solely to demonstrate the scope of development.
